

Side Effects of Micardis

Micardis: **A good choice for Blood Pressure Control and Heart Disease Protection**
Micardis: **Very few Side Effects**

Another reason that Micardis is a **good choice for Blood Pressure Control and Heart Disease Protection** is the very few side effects it has. For example, as doctors, we know that if we give medications that cause unwanted side effects, that patients will NOT take their tablets. Then people will not get the full benefit and protection.

That's where Micardis really shines. For example, one of the very troublesome side effects from a very common type of blood pressure pill known as ACE Inhibitors is an ongoing, chronic cough. Patients would develop this constant tickle, an ever present irritation, in their throats. Eventually, they would stop taking their medications completely.

I am pleased to report that Micardis has a much better tolerability, with far fewer people suffering side effects, particularly this limiting problem of chronic cough.

This is another of the benefits of the newer generation blood pressure medications known as ARBs, such as Micardis.
